

# ESPON QoL – Quality of Life Measurements and Methodology

Annex to the Draft Final Report

Applied Research

**Final Report**

**30<sup>th</sup> October 2020**

# Final Report

This applied research activity is conducted within the framework of the ESPON 2020 Cooperation Programme.

The ESPON EGTC is the Single Beneficiary of the ESPON 2020 Cooperation Programme. The Single Operation within the programme is implemented by the ESPON EGTC and co-financed by the European Regional Development Fund, the EU Member States and the Partner States, Iceland, Liechtenstein, Norway and Switzerland.

This delivery does not necessarily reflect the opinion of the members of the ESPON 2020 Monitoring Committee

## **Project team**

Carlo Sessa, Giorgia Galvini, Institute of Studies for the Integration of Systems – ISINNOVA (Italy)  
Oriol Bioscal, Harold del Castillo, MCRIT (Spain)  
Herta Tödtling-Schönhofer, Jasmin Haider, Metis (Austria)  
Daniel Rauhut, Teemu Makkonen, University of Eastern Finland – UEF (Finland)  
Maarten Kroesen, TUDelft (Netherlands)

## **Project Support Team**

# 1 Territorial Quality of Life Dashboard Tool

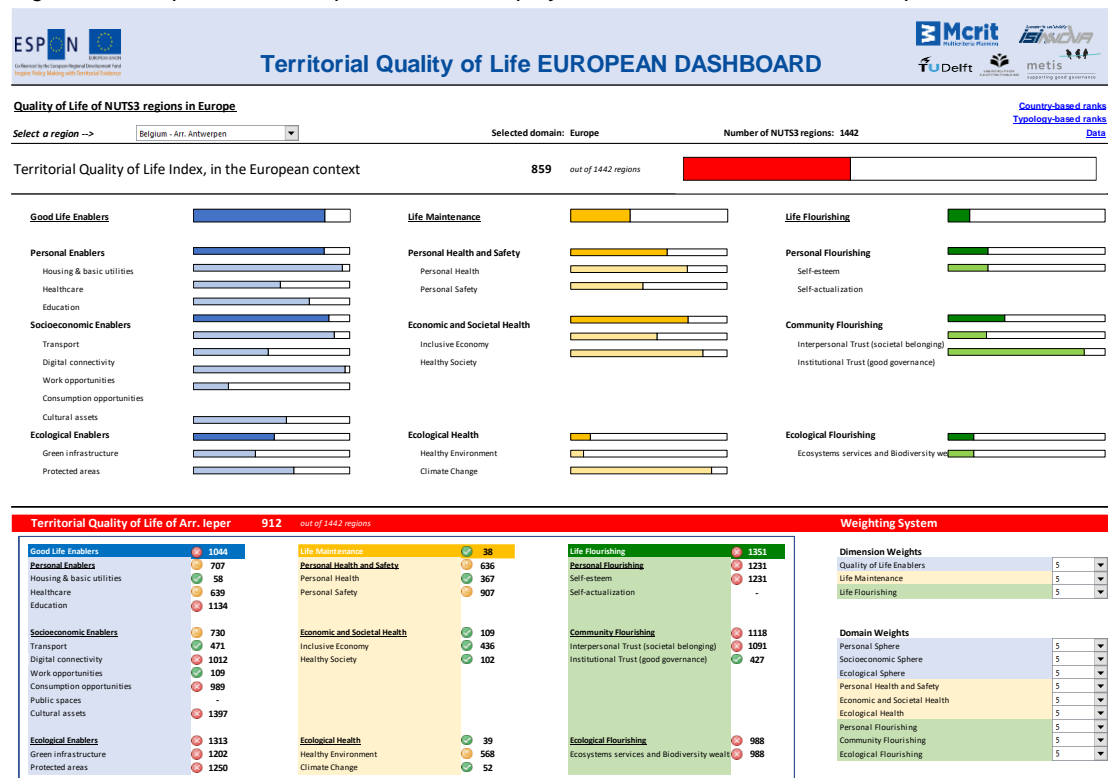

## 1.1 Quality of Life Dashboard

To illustrate the QoL methodology an excel tool has been made, which allows policy makers to explore the relationships between various structural conditions of EU regions (NUTS 3 regions) and different aspects of Quality of life at different levels (sub-domains, domains, dimension and global).

The regions considered are the ones located in the 27 European Union countries, in the United Kingdom, the EFTA countries (CH, NO, LI & IS) and the WBC with an ESPON official NUTS3 territorial divisions (AL, ME, MK & RS).

The Dashboard has been developed to visualize in an understandable and a comprehensive way the TQoL Index results, the tool allows us to make a quick assessment of any European region at NUTS 3 level.

Figure 1 TQoL performance representations displayed in the dashboard for the European context.

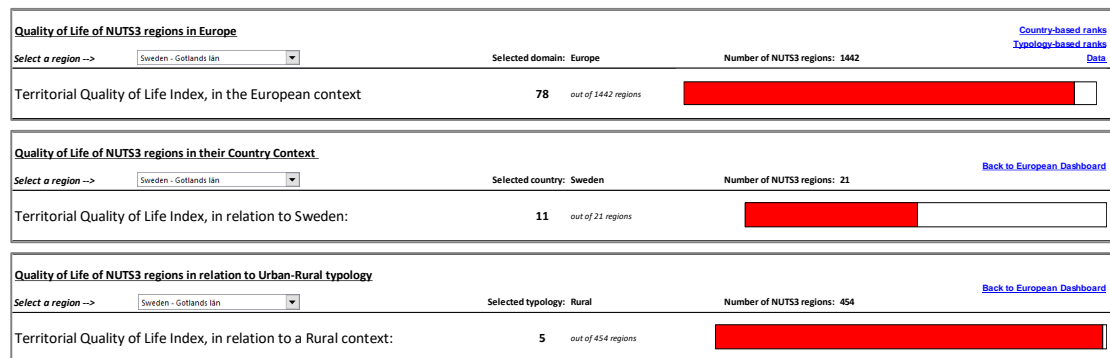

The performance of the region analysed has been made ranking the TQoL index values in a selected context. We ranked the values according to 3 different territorial contexts:

- European context, it shows the performance of the region compared to the 1442 NUTS3 European regions.
- Country context, it shows the performance of the region compared to the other regions of the same country.
- Urban-rural typology, it shows the performance of the region compared to the regions with the same urban-rural typology (381 urban regions, 607 intermediate regions or 454 rural regions).

The following figures are just an example of how a European region is portrayed according to the criteria above. In the specific case, the SE214 Gotlands län region in Sweden ranks

- 78 out of all 1442 NUTS regions in Europe in terms of QoL
- 11 out of 21 regions in Sweden
- 5 out of 454 rural regions in Europe

Figure 2 Territorial QoL Index global performance representation of the Gotlands län region in the European (top), national (middle) and urban (bottom) contexts.

For each of the 3 contexts, the region's TQoL performance is represented in 2 ways,

- The first one is a graphic representation composed by bars, the fuller the bar the better the individual score of the region for an specific domain, subdomain or dimension, thus the higher is the ranking position of the region in the selected context.

The second representation, is a numeric one where it shows the exact ranking position of the region followed by a visual indicator (🟢🟡🔴), indicating in green that the region is ranked among the TOP third of the regions considered, yellow the intermediate third, and red the bottom third. The Dashboard also allows you to define a weighting system at the domain (9 domains) and dimension (3 dimensions) levels. Each domains and dimension can be given a weight value between 1 and 9. This allows you to prioritize the different aspects defined in the Territorial QoL framework to calculate a more accurate Quality of Life Index aligned with the priorities of the region typology (e.g. urban-rural typology).

## 1.2 Dashboard Tool for local policy makers

A version of the Dashboard tool has been created to allow local policy makers analysing Territorial Quality of Life in smaller contexts using the same framework defined at a European level.

The tool allows introducing customised indicators for each of the TQoL dimensions, then performs all the necessary normalisation processes, calculates the Territorial Quality of Life Index at different levels (sub-domain, domain, dimension and global) and displays results using the same interface as the European wide tool.

### Structure

The Dashboard tool is composed by 3 tabs:

- ESPON Dashboard tab. It shows the graphic and numeric representation of performance of the selected region compared to the total number of regions considered. Users can change the weights of the different variables as observe resulting outputs.
- DATA tab. In this tab users introduce their own indicators. Normalization of variables is performed automatically.
- THERY tab. It synthesises the theoretical framework of the Territorial Quality of Life index; it should be used as a guide to classify the indicators by sub-domains.

## How to use

### 1. Indicators selection and data gathering

Users need to identify a list of indicators that will be used to represent each of the TQoL components (each of the sub-domains defined in the framework). To assist users in this regards, there is tab in the Dashboard tool named “Framework” that contains the code system (sub-domains, domains and dimension) and which indicators can fit in each sub-domain. The following figure show the information contained in the “Framework” tab.

Figure 3 Coding indicators system

Dim.	Dom.	Sub-domain	WHAT	WHY
Good of Life Enablers	Personal Enablers	Housing & basic utilities (b1)	Indicators of availability and affordability (market price, social housing of houses and housing space. Indicators of quality of the housing stock and built environment (e.g. respect of urbanistic standards). Indicators of availability and affordability (prices and taxes) for energy, water supply and sewage, and waste collection and treatment services.	The availability and affordability of good housing and basic utilities is a pre-requisite for choosing to settle/live in a place
		Healthcare (b12)	Indicators of availability, accessibility, and affordability (prices and taxes) for health infrastructure and services. Indicators measuring the quality of the infrastructure and services.	The availability or accessibility in a reasonable time threshold of hospitals and other health care facilities is a basic need for life
	Socioeconomic Enablers	Education (b13)	Indicators of availability, accessibility, and affordability (prices and taxes) for education infrastructure and services. Indicators measuring the quality of the infrastructure and services.	The availability or accessibility in a reasonable time threshold of primary, secondary, high school is a basic need for the households with children to settle/live in a place.
		Transport (b21)	Indicators of availability, accessibility, and affordability (prices and taxes) for transport infrastructure and services. Indicators measuring the quality of the infrastructure and services.	Transport infrastructure and services are a pre-requisite for the people to move around and travel from/to their places
		Digital connectivity (b22)	Indicators of availability and affordability (prices) of ICT connection. Indicators measuring the usage and quality of the ICT connection.	Good broadband connections are a pre-requisite to access to the Web and online interaction opportunities.
Ecological Enablers	Work opportunities (s2)	Indicators of availability and accessibility of jobs (workplaces). Indicators measuring the quality of the workplaces (e.g. safety and comfort, respect of humanistic standards, maintenance)	The availability or accessibility in a reasonable commuting time of job opportunities is a pre-requisite to participate in the labour market. The quality of the workplaces influences the quality of people's working life.	
	Consumption opportunities (s24)	Indicators of availability and accessibility of shops and other services (e.g. entertainment) and online delivery. Indicators measuring the quality of the consumption places (e.g. safety and comfort, respect of humanistic standards, maintenance)	The availability and accessibility in a reasonable time threshold of shops and service facilities influence the range of consumption choice. The area for the availability affect online deliveries.	
Personal Health and Safety	Public spaces (b25)	Indicators of availability and accessibility of public spaces. Indicators measuring the quality of the public spaces maintenance.	Good public spaces facilitate social life	
	Cultural assets (b26)	Indicators of availability, accessibility, and affordability (prices) of cultural assets (e.g. heritage sites, museums etc.) Indicators measuring the usage and the quality of the cultural assets' maintenance	The availability and accessibility in a reasonable time threshold of cultural assets and options widen the range of quality of life experiences	
	Green infrastructure (b31)	At a wider territorial scale, this includes indicators of connectivity of green areas (parks, meadows) and the preservation of the agricultural landscape. At the local level, indicators of urban green infrastructure, blue-green infrastructure, etc.	Availability of and access to green spots is key for health, sport and relax activities in the city, and to boost biodiversity in the environment	
Life Maintenance	Protected areas (b32)	Indicators of availability and accessibility of natural protected areas (e.g. areas where flora, fauna, landscape is preserved, which makes protected areas different from other green infrastructure)	Accessible protected areas augment the opportunities to live in contact with nature	
	Personal Health (m1)	Objective and subjective outcome indicators of status of personal health, nutrition, physical activity	Being in and perceiving a good health – body and mind – status is a fundamental quality of life ingredient	
Economic and Social Health	Personal Safety (m12)	Objective and subjective outcome indicators of personal security, safety against accidents.	By the same token, being in and/or perceiving to live in a safe place is also fundamental for people quality of life	
	Inclusive Economy (m21)	Mainly objective outcome indicators related to unemployment and employment rates, gender employment and salary gap, job security, work dignity, disposable income distribution, inequality of financial/net asset wealth of households (personal saving, house ownership, etc.)	An inclusive economy, low unemployment and high work security and dignity are a key ingredients for the people quality of life. The sub-domain does not include GDP or local productivity indicators, with aspects of saving and wealth distribution, equity, economic cohesion in the territory. Local productivity indicators are obviously important for local/regional development strategies, but the TQoL “Inclusive economy” indicators focus on the split-over of economic progress in terms of benefits for the citizens. They are complementary to GDP measurement – an endogenous and a collinear factor	
Ecological Health	Healthy Society (m22)	Mainly objective outcome indicators related to social disparities (position of at risk diversity, working poor families, social security coverage, work-life balance).	An healthy and not too unequal society influences the quality of life by reducing sources of stress and tensions	
	Healthy Environment (m31)	Objective and subjective outcome indicators related to the state of the environment (air quality, water quality, noise pollution, soil contamination)	An healthy environment protogates life expectancy, reducing morbidity, and influences the subjective well-being of people	
Life Flourishing	Climate Change (m32)	Objective and subjective outcome indicators related to greenhouse gases emissions, decarbonization of the economy (economic activities, public and individual transport, housing, etc.), vulnerability prevention and preventive efforts, adaptation and access to Disaster Risk Reduction (DRR) policies and means (resources, plans, protection infrastructure), climate change impacts (vulnerability and adaptation), awareness and climate-friendly behaviour	Low greenhouse emissions contribute to reduce the climate change risks for the present and future generations. Resilience to extreme events is fundamental to reduce people vulnerability and exposure to the harmful effects of climate change. Climate-friendly awareness will bring more sustainable consumption habits and lifestyles.	
	Personal Flourishing	Self-esteem (f1)	Mainly subjective outcome indicators related to recognition and respect from others and of self-respect. Social tolerance (e.g. respect for minorities, disabled, LGBT)	Self-esteem is a pre-requisite for living a good life
Community Flourishing	Self-actualization (f2)	Mainly subjective outcome indicators of self-realization of one's full potential (e.g. life satisfaction with jobs, mate acquisition, parenting, utilizing, and developing abilities and talents, pursuing goals). Objective labour market indicators of jobs matching with skills and competences	Appropose full life is also a key ingredient of a good life	
	Interpersonal Trust (societal belonging) (f21)	Objective and subjective outcome indicators of interpersonal trust (social capital)	The sense of belonging to a community and interpersonal trust influences the quality of life perception and experience	
	Institutional Trust (good governance) (f22)	Objective and subjective outcome indicators of institutional trust (governance). This category includes also active citizens participation as a tool to build or rebuild trust in public realm.	Trust in institutions is a key factor for the quality of community	
Ecological Flourishing	Ecosystems services and Biodiversity wealth (f23)	Indicators measuring the quantity and variety of ecosystem services in the territory sustaining quality of life preparation for all living species (biodiversity)	The quantity and quality of ecosystem services is key to ecological flourishing, and indirectly to evergreen people health and reduce the risks of extreme events.	

### 2. Variable definition

Once users have defined a list of indicators to be used, classified by the sub-domains of the TQoL index, they can proceed to introduce the data in the Dashboard tool.

The indicators should be introduced in the “QoL Data” tab:

Firstly, users need to introduce the name of the regions, counties, neighborhoods that will be considered (column B) and the code of these regions -if any- (column A). The tool allow to introduce up to 80 registers.

Secondly, users have to introduce the indicators in the selected sub-domains (they can add 2 indicators per sub-domain).

Thirdly, the calculation criteria needs to be defined. The calculation criteria are four:

- Bottom outliers: it defines the bottom percentile of which values you want to discard as bottom outliers
- Top outliers: it defines the top percentile of which values you want to discard as top outliers
- Indicator typology: it defines the nature of the indicator, it will be “positively” if the indicator has a positive contribution to quality of life (e.g. number of primary schools) or “negatively” if it is a negative contribution to quality of life (e.g. early school leavers)

- Skewness correction: it defines if the tool should apply a log10 transformation to correct the skewed data (Y = yes, N = no), the tool indicates which indicators present skewed data and if the log10 transformation can be applied.

The following figure shows an example of the table to be filled in the “QoL Data” tab. It shows 4 indicators classified among the first 4 sub-domains (b11, b12, b13 & b14) and the indicator data of the first 10 registers.

Figure 4 QoL Data tab

**How to use?**

- Fill in indicators of quality of life in the table below and define the sub-domain (green cells). One indicator per column (by default there is space for 2 indicators per sub-domain). [Check indicator definitions here](#)
- Check if skewness correction is needed. (no red cells in this line indicate all data is correct!)  
Can Log10 transformation be applied? (red cells in this line indicate all log10 can not be applied!)
- Select if correction shall be applied (log10)
- Cut **top** outliers (%centile to be excluded)
- Cut **bottom** outliers (%centile to be excluded)
- State if indicator positively influences QoL or negatively

State [Y/N] ->		skewed data		correct data? Y/N		correct data? Y/N			
		Yes		No		No			
		correct data? Y/N		correct data? Y/N		correct data? Y/N			
		Y		N		N			
97%		97%		97%		97%			
3%		3%		3%		3%			
negatively		positively		positively		positively			
Sub-domain ->		b11	b11	b12	b12	b13	b13	b21	b21
Code	Region name	6 - Main homes without heating (AyuntBCN)		247 - Area of the neighborhood intended for health services (%) (OpenDataBCN)		252 - Area of the neighborhood intended for education services (%) (OpenDataBCN)		261 - % Population with a public transport accessibility index (PTAI) over the average (ATM)	
1	el Raval	0,11	-	0,06	-	0,05	-	1,00	-

### 3. Results

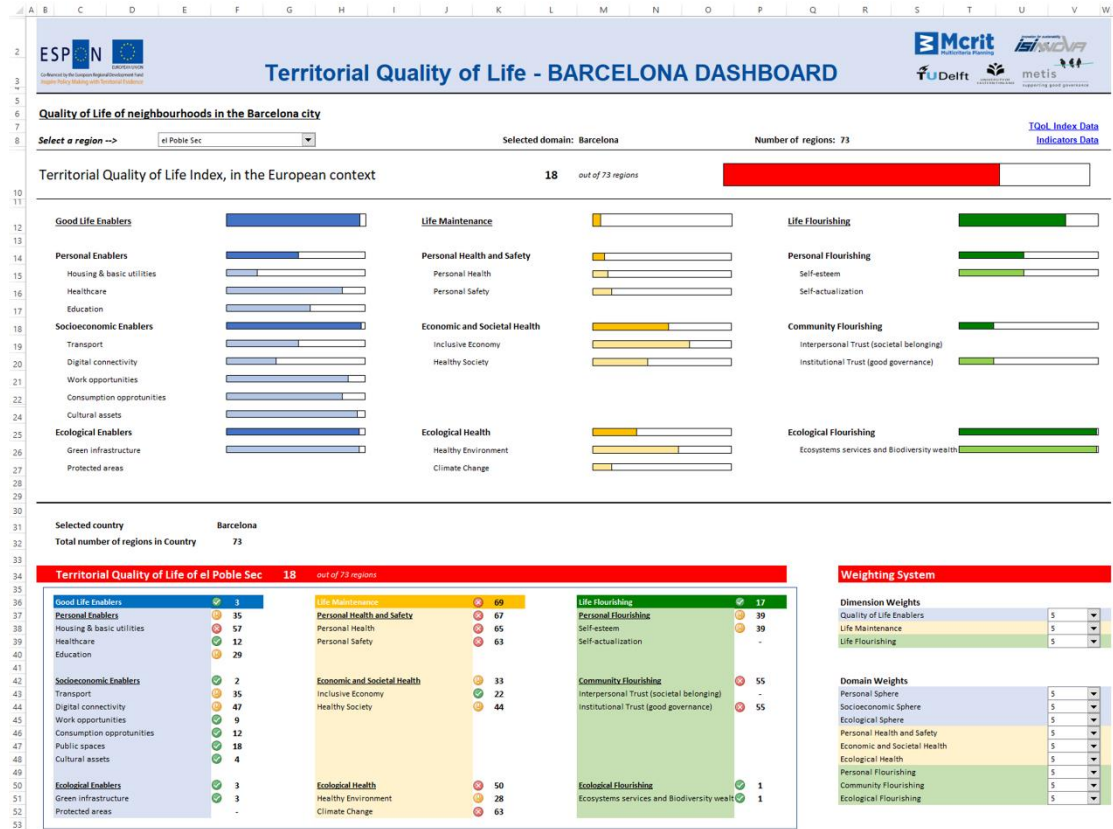

After introducing the indicators and defining the normalization variables, the results will be displayed in the “ESPON Dashboard” tab.

The region’s TQoL performance is represented in a graphic representation composed by bars and in a numeric one where it shows the exact ranking position of the region followed by a visual indicator (🟢🟡🔴).

In this same tab (row 34, column R), you can define your own weighting system at a domain and dimension level. It allows to align the results according to the preferences of each context established by the user.

The following figure shows the “ESPON Dashboard” results representation and the weighting system.

Figure 5 ESPON Dashboard tab

## 2 Indicators & Mapping

### 2.1 TQoL dashboard methodology

Methodologically, our work builds upon the OECD Handbook on Constructing Composite Indicators. (OECD JRC 2008). The specific methodology for measuring quality of life at regional level, including weighting for different types of territories, encompasses five steps:

**Step 1. Selection of QoL indicators.** To ensure coherence with current policies and contributions to current state of the art, the indicators should be complementary to the EUROSTAT, OECD and UN datasets measuring progress towards the Sustainable Development Goals (SDG); be able to capture the effects of regional policy interventions, and have a high political, technical and communication utility. Pragmatically, in order to build an operational and complete composite index, indicators have been selected based on their availability at NUTS 3 level, their completeness (estimates are performed extrapolating from parent NUTS 2 regions and exceptionally from NUTS 0 when missing data are limited), and time series availability (considering relatively high inertia of Quality of Life, five- to 10-year intervals between successive estimates are considered enough). Still, the pragmatic approach is only used in the selection to build an operative QoL index based on what exists today, but the definition of the theoretical framework itself is based on what is desirable to measure and not on which indicators are available, as proposed by the OECD Handbook. The difference between both approaches will pave the way to recommend further (coordinated) efforts to fill the data gaps.

**Step 2. Data harmonisation.** Carried out to render the variables comparable. Outliers in the dataset are identified and excluded. Highly skewed distributions are transformed (logarithmic and power transformations). Indicators are normalised in a range [0-1].

**Step 3. Weighing QoL indicators.** Weighting currently occurs through the hierarchical organisation of indicators in three dimensions, nine domains and 22 sub-domains. Dimensions are aggregated with a generalised weighted mean of power of 0.5; variables in domains and sub-domains all weight equal. As stated by the OECD Handbook, this approach is the most common when variables are all intended to be “worth” the same in the composite index, or also in the absence of a statistical or an empirical basis allowing for differentiated weighting. However, what the TQoL dashboard tool produced so far allows for changing weights of each indicator within domains and sub-domains, for instance to apply weights after a consultation with groups of experts, stakeholders of citizens.

**Step 4. Indicator testing and validation.** To test and validate the indicators, we performed a sensitivity analysis of alternative weights and nesting options, a comparison with consolidated composite indices and other synthetic indicators of well-being (DG Regio EU-SPI index, Hannel QoL index; Life Expectancy at birth and GDP per capita), an assessment carried out with the ESPON QoL Advisory Group to validate a proposal of indicators based on our own assessment of data availability and partial results at the European level. Finally, we take into account also further insights from case studies, suggesting changes in the TQoL overall framework.

**Step 5. Indicator analysis and visualisation.** The fourth step is organised in an iterative loop with the previous Steps 3 and 5. Analysis and visualisation lead to a new round of validation, and then to a new round of mapping and analysis until results are sufficiently robust.

### 2.1 Selection of Territorial Quality of Life indicators at European level

Based on the above criteria, the selection of TQoL indicators proposed for the European level (ESPON area; NUTS 3) is shown in the following table.

Table 1 Existing indicators selected to fill the TQoL framework at European level (ESPON area NUTS 3)

Dim.	Dom	Sub-domain	What should indicators describe in this sub-domain?	Selected indicators based on data availability	Rationality of indicator choice	Limitations of selected indicators and improvements
Quality of Life Enablers	Personal Sphere	Housing & basic utilities (b11)	<p>WHAT: Indicators of availability and affordability (market prices, social housing) of houses and housing space. Indicators of quality of the housing stock and built environment (e.g. respect of planning standards). Indicators of availability and affordability (prices and taxes) for energy, water supply and sewage, and waste collection and treatment services.</p> <p>WHY: The availability and affordability of good housing and basic utilities is a pre-requisite for choosing to settle/live in a place.</p>	Sanitation conditions (% uncollected sewerage & % sewerage treatment)	It aims to represent household conditions regarding the sewage system	<p>The indicators used focus on quantity of services available due to data availability. More information would be needed in relation to quality perception and satisfaction with household conditions (sanitation, heating &amp; cooling systems, isolation, housing affordability).</p>
				Households lacking adequate heating	It aims to represent the lack of basic utilities (heating)	
				Household overcrowding	It aims to represent the living conditions (overcrowding)	
				Burdensome cost of housing	It aims to represent the affordability of housing	
		Health (b12)	<p>WHAT: Indicators of availability, accessibility, and affordability (prices and taxes) for health infrastructure and services. Indicators measuring the quality of the infrastructure and services.</p> <p>WHY: The availability or accessibility within a reasonable time threshold of hospitals and other health care facilities is a basic need for life.</p>	Availability of Hospital beds	It aims to represent the availability to basic health services such as hospital beds.	<p>The indicators used focus on quantity of services available due to data availability. More information would be needed in relation to quality perception or satisfaction with "health" services accessibility</p>
				Accessibility to health services (pharmacies, doctors and hospitals)	It aims to represent the availability to health services using as a proxy the percentage of area categorized as "highly accessible" to pharmacies, hospitals and doctors.	
	Education (b13)	<p>WHAT: Indicators of availability, accessibility, and affordability (prices and taxes) for education infrastructure and services. Indicators measuring the quality of the infrastructure and services.</p> <p>WHY: The availability or accessibility in a reasonable time threshold of primary, secondary, high schools is a basic need for the households with children to settle/live in a place.</p>	Accessibility to education (primary and secondary schools)	It aims to represent the accessibility of education using as a proxy the percentage of area categorized as "highly accessible" to primary or secondary schools	<p>The indicators used focus on quantity of services available due to data availability. More information would be needed in relation to quality perception or satisfaction with the accessibility (commuting time, transport mode...), availability and affordability (budget destined to education...) of educational centers</p>	
	Socioeconomic Sphere	Transport (b21)	<p>WHAT: indicators of availability, accessibility, and affordability (prices and taxes) for transport infrastructure and services. Indicators measuring the quality of the infrastructure and services.</p> <p>WHY: Transport infrastructure and services are a pre-requisite for the people to move around and travel from/to their places.</p>	Access to high-level transport infrastructure	It aims to represent the accessibility to transport services using as a proxy an index evaluating the (airports, ports, highway) accessibility to main transport infrastructures	<p>The indicators used focus on quantity of services available due to data availability. More information would be needed in relation to quality perception or satisfaction with the accessibility, availability and affordability of transport infrastructures and services.</p>
		Internet at home	It aims to represent the availability of internet at home			
		Online interaction with public authorities	It aims to represent the people willingness to use ICT connections			
		Work (b23)	<p>WHAT: Indicators of availability and accessibility of jobs (workplaces). Indicators measuring the quality of the workplaces (e.g. safety and comfort, respect of urbanistic standards, maintenance)</p> <p>WHY: The availability or accessibility in a reasonable commuting time of job opportunities is a pre-requisite to participate in the labour market. The quality of the workplaces influences the quality of employers'/employees' life.</p>	Labour market accessibility (accessibility to jobs)	It aims to represent the accessibility of jobs using as a proxy the amount of people living within four hours of driving from the location at hand	<p>More information would be needed in relation to quality perception or satisfaction with the accessibility, availability and quality of jobs.</p>
		Consumption (b24)	<p>WHAT: Indicators of availability and accessibility of shops and other services (e.g. entertainment) and online delivery. Indicators measuring the quality of the consumption places (e.g. safety and comfort, respect of planning standards, maintenance)</p> <p>WHY: The availability and accessibility in a reasonable time threshold of shops and service facilities influence the range of consumption choice. The same for the availability of fast online deliveries.</p>	Accessibility to commercial services (shops and banks)	It aims to represent the accessibility to consumption using as a proxy the percentage of area categorized as "highly accessible" to shops and banks	<p>The indicators used focus on quantity of services available due to data availability. More information would be needed in relation to quality perception or satisfaction with the accessibility, availability of consumption places (shops, entertainment...)</p>
Public spaces (b25)		<p>WHAT: Indicators of availability and accessibility of public spaces. Indicators measuring the quality of the public spaces' maintenance.</p> <p>WHY: Good public spaces facilitate social life.</p>	Not relevant at NUTS3 level	Not relevant at NUTS3 level	Not relevant at NUTS3 level	
Cultural Assets (b26)	<p>WHAT: Indicators of availability, accessibility, and affordability (prices) of cultural assets (e.g. heritage sites, museums etc.). Indicators measuring the usage and the quality of the cultural assets' maintenance.</p> <p>WHY: The availability and accessibility in a reasonable time threshold of cultural assets and options widen the range of quality of life experiences.</p>	Availability of cultural landmarks (Unesco World Heritage)	It aims to represent the availability of cultural spots	<p>The indicators used focus on quantity of services available due to data availability. More information would be needed in relation to quality perception or satisfaction with the availability and affordability of cultural spots</p>		
		Accessibility to cultural services (cinemas)	It aims to represent the availability of cultural spots			
Ecological	Green Infrastr.		Availability of Natural Areas	It aims to represent the availability of green areas (forests, herbaceous vegetation, wetlands and inland waters)		

Life Maintenance	Personal Health and Safety	Protected areas (b32)	<p>WHAT: At a wider territorial scale, this includes indicators of connectivity of green areas (woods, meadows) and the preservation of the agricultural mosaic. At city level, indicators of Urban Green (urban parks, street trees, gardens....)</p> <p>WHY: Availability of and access to green spots is key for health, sport and relax activities in the city, and to host biodiversity in the environment</p>	Farmland abandonment (% abandoned land)	It aims to represent the deterioration of land using as a proxy the percentage of abandoned land	The indicators used focus on quantity of natural areas available due to data availability. More information would be needed in relation to quality perception or satisfaction with the availability and quality of green areas and the landscape
		Personal Health (m11)	<p>WHAT: Indicators of availability and accessibility of natural protected areas (i.e. areas where flora, fauna, landscape is preserved, which makes protected areas different from other green infrastructure).</p> <p>WHY: Accessible protected areas augment the opportunities to live in contact with nature.</p>	Existence of Protected Areas	It aims to represent the availability of protected area	The indicators used focus on quantity of protected areas available due to data availability. More information would be needed in relation to quality perception or satisfaction with availability and affordability of protected areas
	Personal Health and Safety	Personal Health (m11)	<p>WHAT: Objective and subjective outcome indicators of status of personal health, nutrition, physical activity.</p> <p>WHY: Being in and perceiving a good health – body and mind – status is a fundamental quality of life ingredient</p>	Life expectancy at birth	It aims to represent the population health using as a proxy the life expectancy	More information would be needed in relation to the satisfactions and perception of personal health, nutrition or physical performance
		Personal Safety (m12)	<p>WHAT: Objective and subjective outcome indicators of personal security, safety against accidents.</p> <p>WHY: By the same token, living in and/or perceiving to live in a safe place is also fundamental for people's quality of life.</p>	<p>Standardised traffic accident death rate</p> <p>Standardised homicide death rate</p>	<p>It aims to represent the road safety</p> <p>It aims to represent the general safety using as a proxy the homicide death rate</p>	More information would be needed in relation to personal safety perception on different aspects (while driving, at home, on the streets...)
	Economic and Societal Health	Inclusive Economy (m21)	<p>WHAT: Mostly objective outcome indicators related to unemployment and employment rates, gender employment and salary gap, job security, work dignity, disposable income distribution, inequality of financial/real estate wealth of households (personal saving, house ownership, etc.)</p> <p>WHY: An inclusive economy, low unemployment and high work security and dignity are a key ingredient for people's quality of life. The sub-domain does not include GDP or local productivity indicators, only aspects of earning and wealth distribution, equity, economic cohesion in the territory. Local productivity indicators are obviously important for local/regional development strategies, but the TQoL "inclusive economy" indicators focus on the spill-over of economic progress in terms of benefits for the citizens. They are complementary to GDP measurement – an orthogonal, not a collinear factor.</p>	Household disposable income per capita	It aims to represent the disposable income	More information would be needed in relation to job security, work dignity, personal savings...
				Gender employment gap	It aims to represent the job equity	
				Unemployment rate	It aims to represent the employment performance	
		Healthy Society (m22)	<p>WHAT: Mostly objective outcome indicators related to social disparities (population at risk of poverty, working poor families, social security coverage, work-life balance).</p> <p>WHY: A healthy and not too unequal society influences the quality of life by reducing sources of stress and tensions</p>	<p>People at risk of poverty rate</p> <p>Early Leavers from education (18-24)</p> <p>Tertiary Educational Attainment (25-64)</p> <p>NEET 15-24</p>	<p>It aims to represent the financially vulnerable population</p> <p>It aims to represent the educational level of the population</p> <p>It aims to represent the educational level of the population</p> <p>It aims to represent the educational/labour level of the population</p>	More information would be needed in relation to social security coverage and work-life balance.
	Ecological Health	Healthy Environment (m31)	<p>WHAT: Objective and subjective outcome indicators related to the status of the environment (air quality, water quality, noise pollution, soil contamination)</p> <p>WHY: A healthy environment prolongates life expectancy, reducing morbidity, and influences the subjective well-being of people</p>	Air Quality	It aims to represent the air quality using as a proxy an air index that considers the main pollutants (PM, NOx and SOx)	More information would be needed in relation to quality perception or satisfaction with air and noise pollution, water quality and soil contamination.
		Climate change (m32)	<p>WHAT: Objective and subjective outcome indicators related to greenhouse gases emissions, decarbonisation of the economy (economic activities, public and individual transport, housing, etc.), vulnerability, presence and persistence of risks, adaptation and access to Disaster Risk Reduction (DRR) policies and means (resources, plans, protection infrastructures), awareness and climate-friendly behaviour.</p> <p>WHY: Less greenhouse emissions contribute to reduce the climate change risks for the present and future generations. Resilience to extreme events is fundamental to reduce people vulnerability and exposure to the harmful effects of climate change. Climate-friendly awareness will bring more sustainable consumption habits and lifestyles.</p>	<p>Aggregate expected impact of climate change by 2070</p> <p>Population covered by Sustainable Action Plans</p>	<p>It aims to represent the impact of climate change</p> <p>It aims to represent the resilience to climate change using as a proxy the population covered by Sustainable Action Plans</p>	More information would be needed in relation to quality perception or satisfaction with aspects related to decarbonation of the economy, GHE and access to disaster risk reduction policies, among others.

Life Flourishing	Personal Flourishing	Self-esteem (f11)	WHAT: Mostly subjective outcome indicators related to recognition and respect from others and of self-respect. Social tolerance (e.g. respect for minorities, disabled, LGBT). WHY: Self-esteem is a pre-requisite for living a good life	Standardised suicide death rate	It aims to represent the self-respect using as a proxy the suicide death rate	More information would be needed in relation to social tolerance about different aspects (minorities) and the self-perception.
				Attitudes toward people with disabilities	It aims to represent the tolerance to others using as a proxy a survey about the tolerance to people with disabilities	
		Self-actualization (f12)	WHAT: Mostly subjective outcome indicators of self-realization of one's full potential (e.g. life satisfaction with jobs, mate acquisition, parenting, utilising, and developing abilities and talents, pursuing goals). Objective labour markets indicators of jobs matching with skills and competences WHY: A purpose-full life is also a key ingredient of a good life.	No data available at NUTS level	No data available at NUTS level	More information would be needed in relation to quality perception or satisfaction with current jobs, civil status (single, in a relationship, married...) and goals achieved.
	Community Flourishing	Interpersonal trust/ societal belonging (f22)	WHAT: Objective and subjective outcome indicators of inter-personal trust (social capital). WHY: The sense of belonging to a community and interpersonal trust influences the quality of life perception and experience.	Population that believe voluntary work is very important	It aims to represent the perception on community activities using as a proxy the voluntary work perception	More information would be needed in relation to quality perception or satisfaction about the local community
				Population participating in associative activities (organizational work or participatory events)	It aims to represent the population willingness to participate in community activities	
		Institutional trust/ good governance (f21)	WHAT: Objective and subjective outcome indicators of institutional trust (governance). This category includes also active citizens participation as a mean to build or re-build trust in policy making. WHY: Trust in institutions is a key factor for the quality of community life.	European Quality of Government Index	It aims to represent the quality of government	More information would be needed in relation to quality perception or satisfaction with government institutions (local, regional and national)
				Trust in the Administration	It aims to represent the population perception on the administration	
	Quality and accountability of government services			It aims to accountability of government services		
	Corruption Index	It aims to represent the corruption level				
	Ecological Flourishing	Biodiversity Wealth (f31)	WHAT: Indicators measuring the quantity and variety of ecosystems services in the territory sustaining quality of life perpetuation for all living species (biodiversity). WHY: The quantity and quality of ecosystem services is key to ecological flourishing, and indirectly to preserve people health and reduce the risks of pandemic outbreaks. The world of living subjects offers a web of dynamics, living and unfolding creative relationships for constant development.	Invasive Alien Species	It aims to represent the ecosystem quality using as a proxy the number of invasive alien species	More information would be needed in relation to quality perception or satisfaction with biodiversity and policies aiming to preserve the ecosystems
				Ecosystem services net value (Supply-Demand)	It aims to represent the value of the ecosystems	

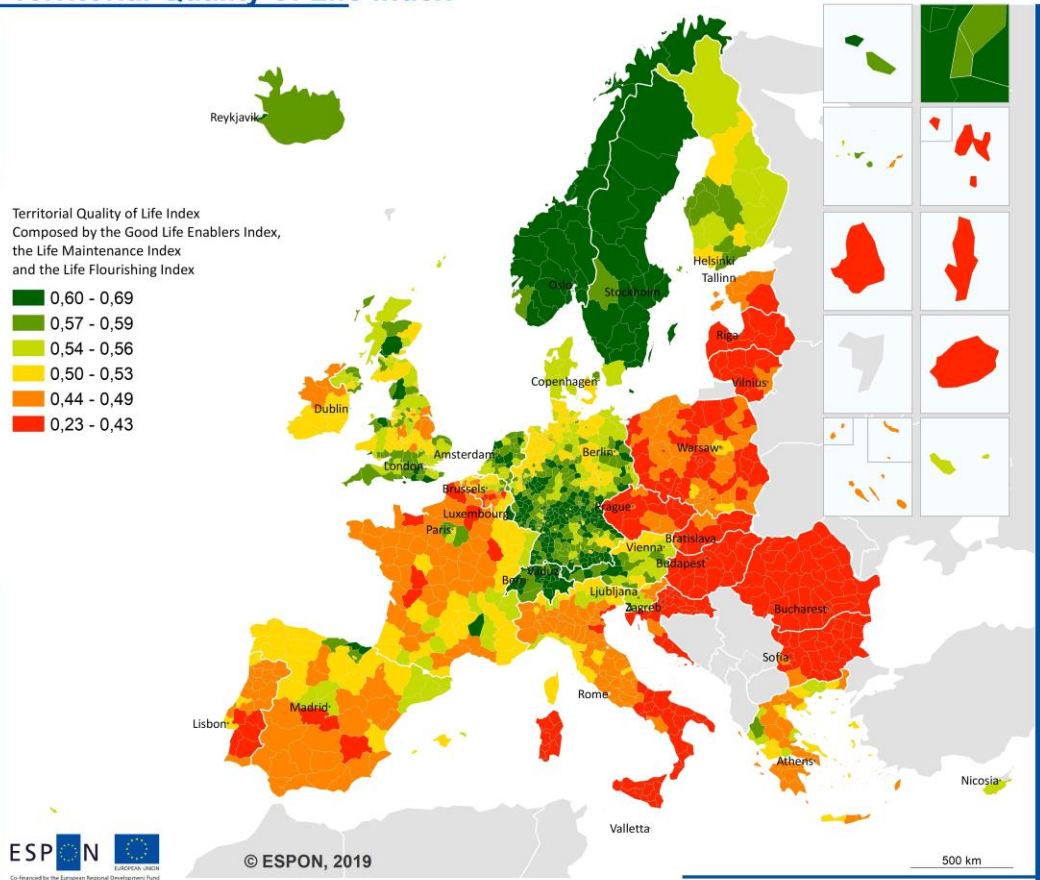

These indicators have been selected after a detailed assessment of the QoL related data availability for all NUTS3 regions in Europe, as illustrated extensively in the project Intermediate Report.

## 2.2 TQoL Global Index

The following maps show the results of the TQoL composite index methodology at European level, displaying first the map for the aggregate TQoL composite index (all three dimensions combined), followed by the maps for each dimension separately – good life enablers, life maintenance, life flourishing. Next, each of the 9 domains and 21 sub-domains composing the 3 dimensions are also displayed.

## Territorial Quality of Life Index

Territorial Quality of Life Index  
Composed by the Good Life Enablers Index,  
the Life Maintenance Index  
and the Life Flourishing Index

## 2.4.1 Economic and Societal Health domain

### TQoL Index - Life Maintenance, Economic and Societal Health

## 2.4.1 Ecological Health domain

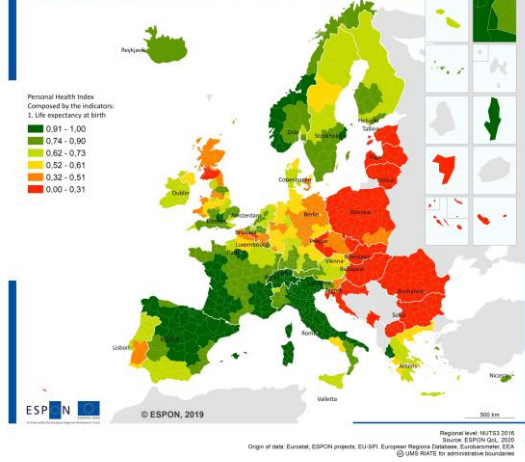

### TQoL Index - Life Maintenance, Ecological Health

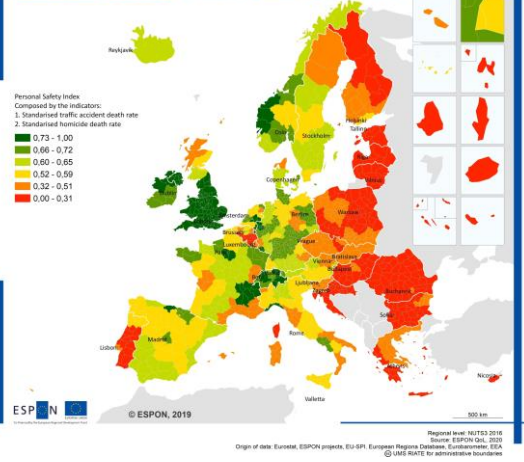

## 2.4.2 Sub-domains

### Personal

TQoL Index - Personal Health and Safety, Personal Health

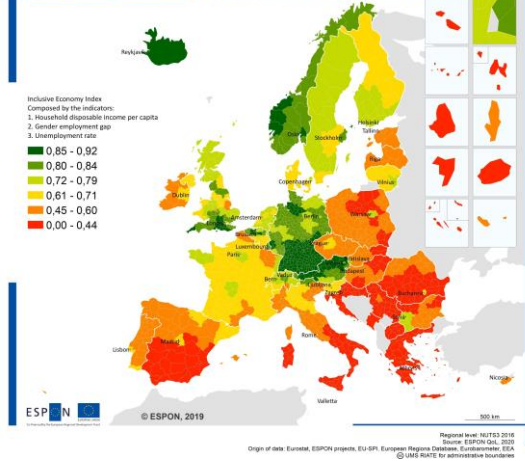

TQoL Index - Personal Health and Safety, Personal Safety

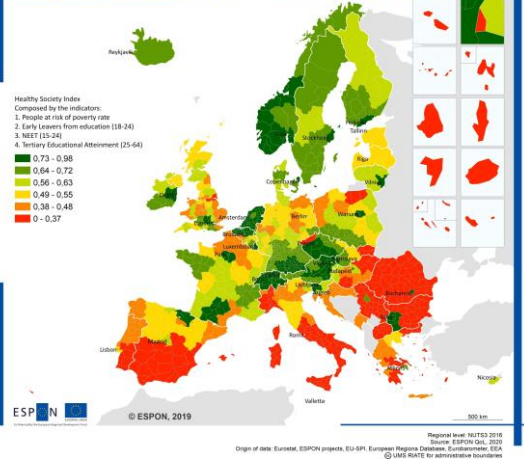

### Socio-economic

TQoL Index - Economic and Societal Health, Inclusive Economy

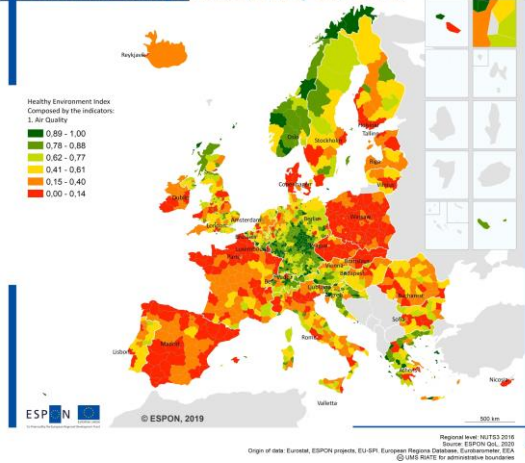

TQoL Index - Economic and Societal Health, Healthy Society

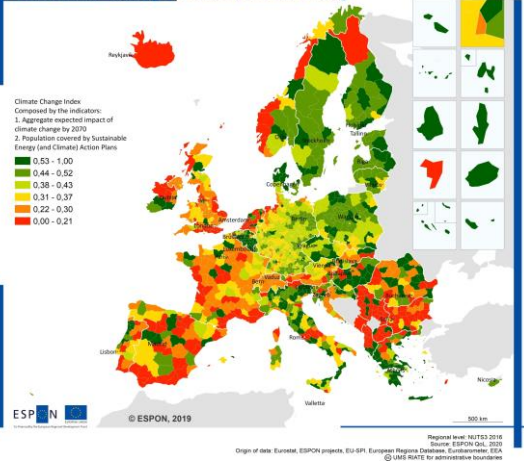

### Environmental

TQoL Index - Ecological Health, Healthy Environment

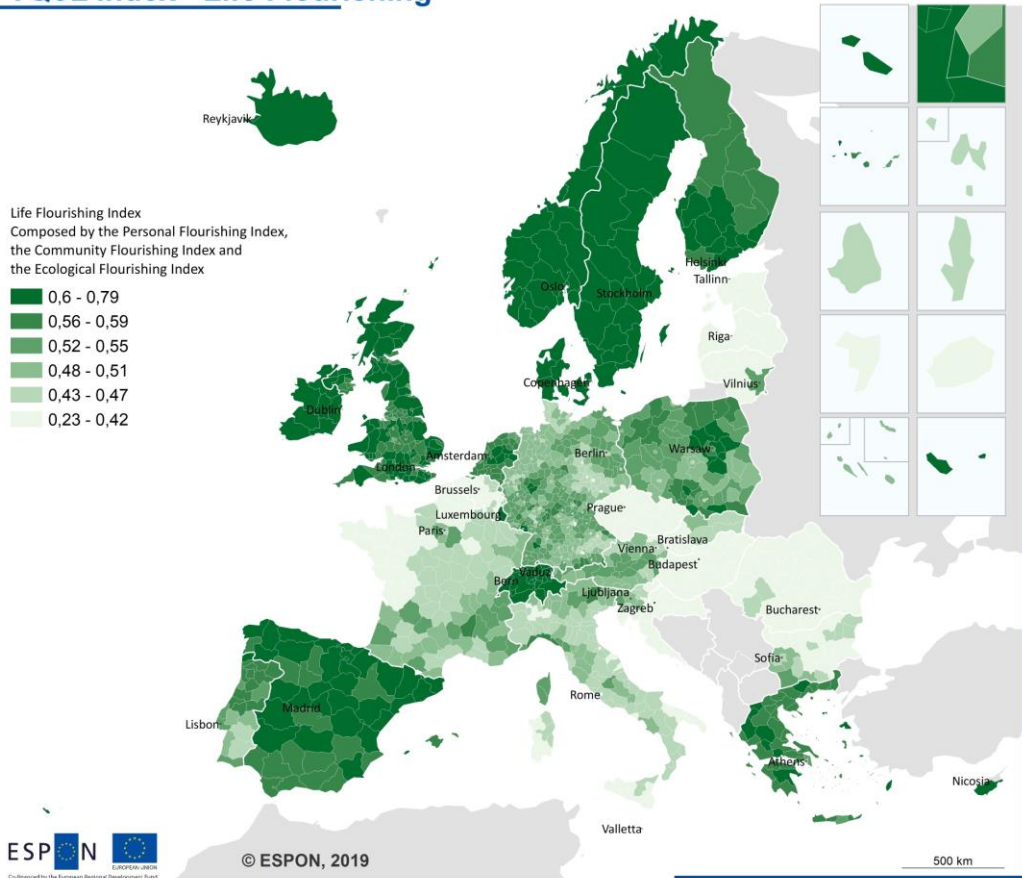

TQoL Index - Ecological Health, Climate Change

## 2.5 Life Flourishing Dimension

### TQoL Index - Life Flourishing

Life Flourishing Index  
Composed by the Personal Flourishing Index,  
the Community Flourishing Index and  
the Ecological Flourishing Index

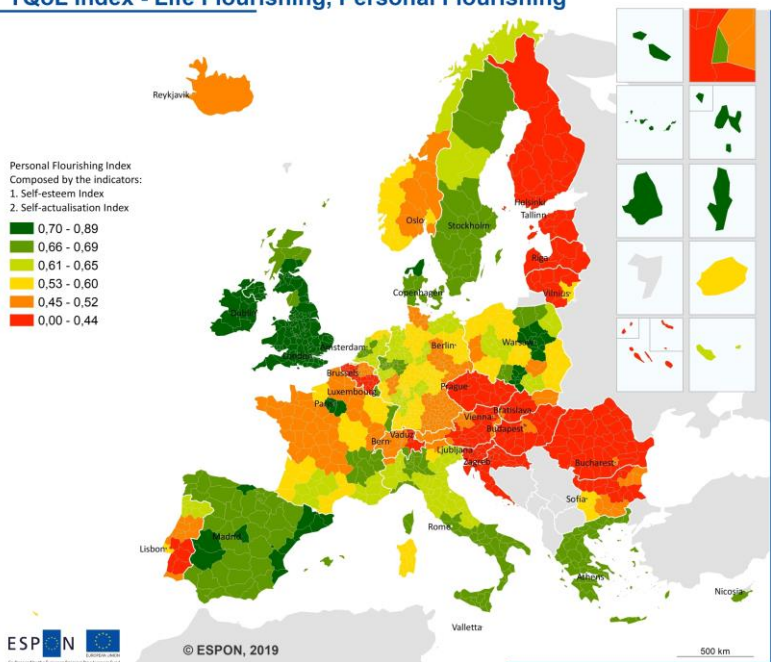

Regional level: NUTS3 2016  
Source: ESPON QoL, 2020  
Origin of data: Eurostat, ESPON projects, EU-SPI, European Regional Database, Eurobarometer, EEA  
© UMS RIATE for administrative boundaries

### 2.5.1 Personal Health and Safety

#### TQoL Index - Life Flourishing, Personal Flourishing

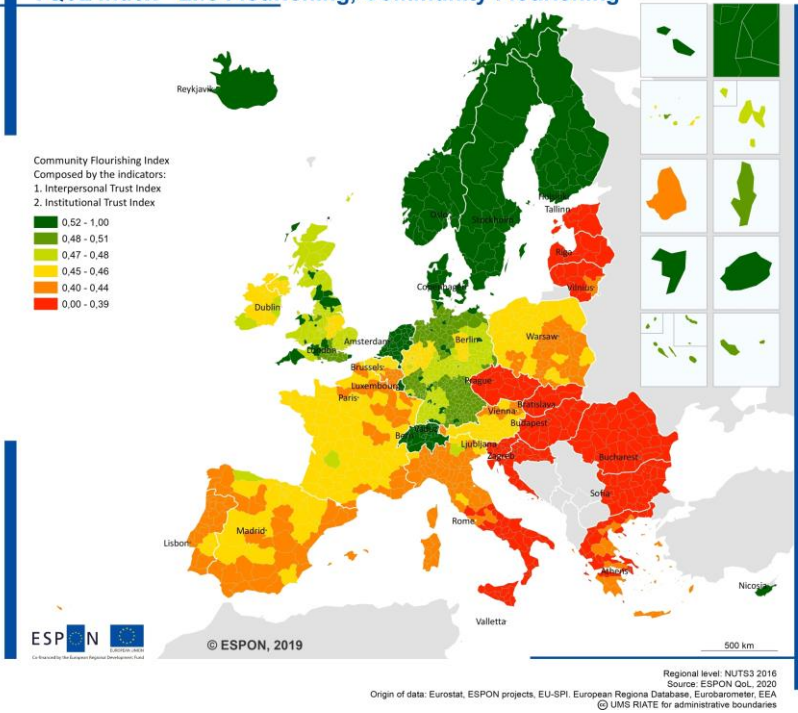

Personal Flourishing Index  
Composed by the indicators:  
1. Self-esteem Index  
2. Self-actualisation Index

Regional level: NUTS3 2016  
Source: ESPON QoL, 2020  
Origin of data: Eurostat, ESPON projects, EU-SPI, European Regional Database, Eurobarometer, EEA  
© UMS RIATE for administrative boundaries

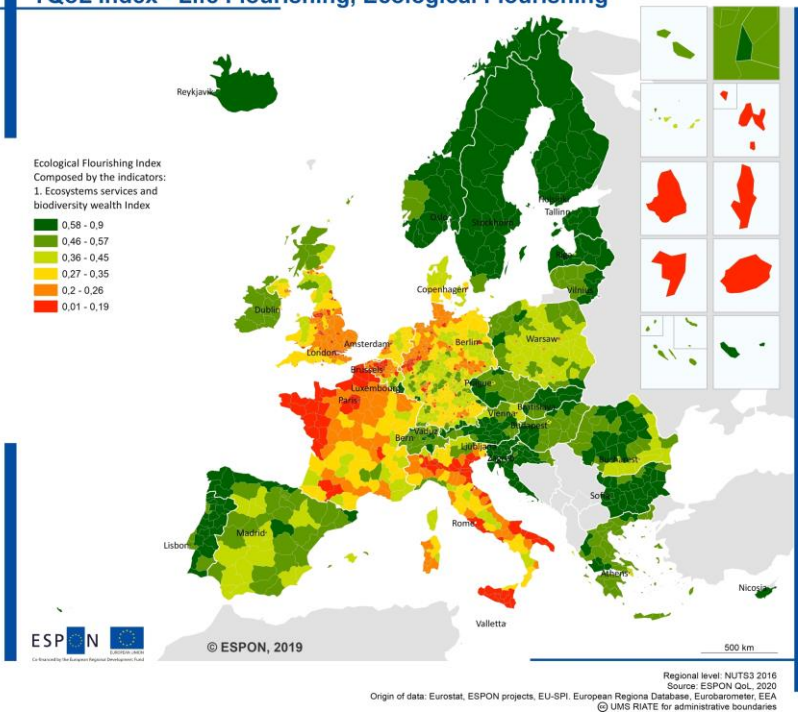

## 2.5.2 Community Flourishing domain

### TQoL Index - Life Flourishing, Community Flourishing

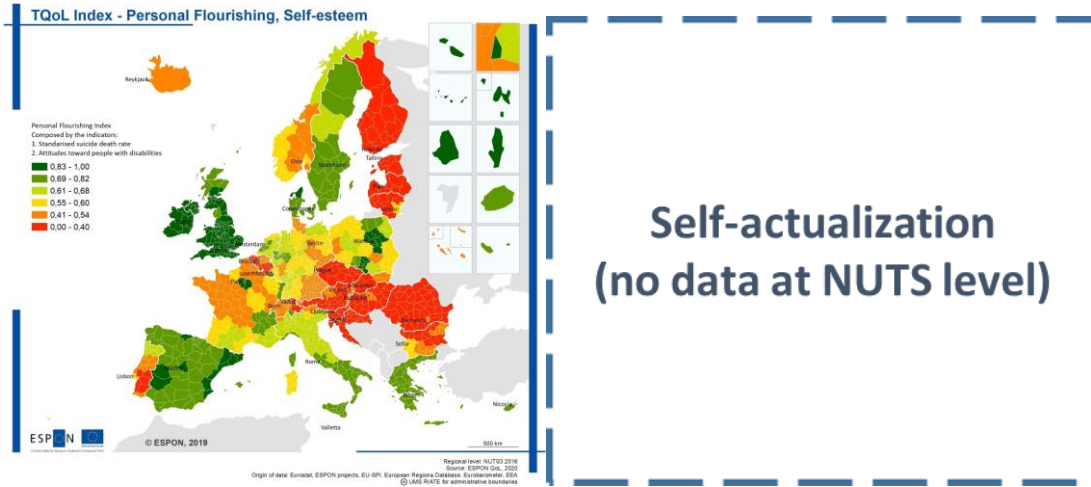

## 2.5.3 Ecological Flourishing domain

### TQoL Index - Life Flourishing, Ecological Flourishing

## 2.5.4 Sub-domains

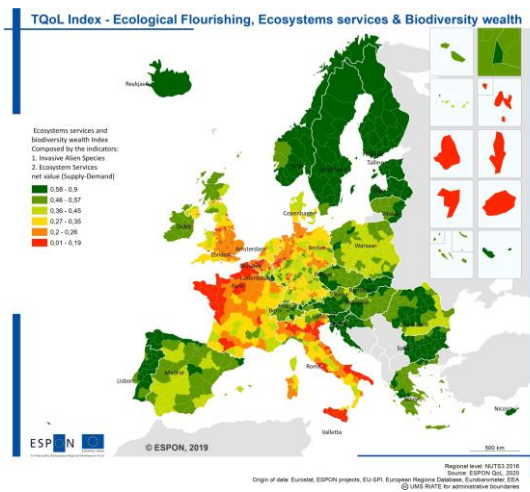

### Personal

### Socio-economic

### Environmental

## 2.6 Quality of Life evolution over time mapping

### 2.6.1 TQoL Index Early 2010s vs Late 2010s

Next, quality of life is depicted for 2010 (left map) compared current quality of life as already presented before (right map).

## 2.6.2 Ranking variation Early-Late 2010s

Next map shows regions that climbed relative positions in the TQoL Index ranking over the last decade. Regions depicted in yellow-red dropped relative positions in the ranking, Regions in green climbed positions.

Regional level: NUTS3 2016
