## Introduction – Background to the analyses

Network theory has lent weight to the need to understand contemporary development processes as essentially articulated by relations between cities. Castells' (1996) theory of a paradigm shift in spatial relations at the end of the twentieth century, interpreted city interrelations in the networked tertiary economy as generating a global 'space of flows' which does not map onto the territorial reference points of states. According to Castells, ICT has brought about an openness of spatial relations constituting "a multi-edged network" (1996, pp. 75-76) within which the new economy is "informational, global, and networked" (1996, p.77) operating on a global scale. However, far from losing importance in this process of spatial transformation, major business cities have continued to be basing points for network centralities in the tertiary world economy as first expounded by Sassen (2001). As operational nodes for informational and financial flows in global networks, cities are interlinked across territorial borders and are characterized by distinctive functional internationality.

This paper engages directly with key questions posed in the TIGER project on the changing position of the European territory as global dispersion and centralizing tendencies impact on its cities in the twenty first century by utilizing data from 'World City Network' (WCN) research.

The Globalization and World Cities (GaWC) research network (GaWC, <http://www.lboro.ac.uk/gawc>) has measured and analyzed the spatial configuration of tertiary knowledge-based business relations in the WCN, using information on the locations of global Advanced Producer Services (APS) firms - banking/finance, accountancy, law, advertising and management consulting firms - with multiple city-based offices worldwide (Taylor 2001, 2004; Taylor et al. 2011). The size and the functions of offices within a given business network generate connections between cities in which they are located. Thus calculating the connectivity conferred on cities in an 'interlocking network model' by multiple global APS networks allows important inter-city relations in the WCN to be described (for technical details about the method see GaWC Research Bulletin 310 (<http://www.lboro.ac.uk/gawc> and Taylor 2004).

The purpose of this paper is to understand the relationship between these business-generated interrelations and territorial space at different geographical scales. By examining the APS connectivity of cities world-wide it is possible to see how the European territory is positioned in contemporary economic globalization. Furthermore, utilizing GaWC data collected in three census periods during the first decade of the twenty first century, it is possible to analyze changes in the structure of European city network (ECN) relations in a global (WCN) context. The approach to analysis adopted is unique in its focus on the territorial effects of developing business practices in globalization which can inform European spatial policy. We use a time-series approach in order to assess how Europe's place in the WCN is changing, especially in the context of the financial crisis which came to a head in 2008, the last census date for which GaWC data are available for analysis in this project. The data thus benchmark the structural evolution of the WCN up until immediately before the impact of the crisis.

Given the role of banking/financial activity in contributing to economic recession, we undertake a sectoral analysis which seeks to understand the changing roles of cities as basing points for these services; the results also inform consideration of the implications of flows of financial capital associated with real estate investments in working paper 9. Analysis of the ways in which different APS sectors are using cities in the WCN also sheds light on which

specific tertiary business activity is interconnecting cities in the world and within Europe, and on sectoral specializations relevant for policy in leading business cities and cities which are globalizing, in the European territory.

## The data and the standardization method

GaWC datasets available for analysis refer to the years 2000, 2004 and 2008. However, time series comparisons across these years was far from straightforward because the composition of the dataset in terms of the number of firms, sectors and cities studied has changed over time, reflecting changes in the structure of the service networks and the cities constituting the WCN. The first data collection in 2000 included six service sectors: banking/finance, accountancy, insurance, law, advertising and management consulting (Taylor, 2001) however insurance was not studied as a separate sector in 2004 due to increasing service integration between insurance and finance functions. In addition, the number of firms studied also changed between 2004 and 2008 due to corporate restructuring (e.g. mergers and acquisitions). For the banking/financial services sector, in 2000, 34 firms were included in the dataset and in 2004, only 29 firms, while the number increased again to 75 firms in 2008. Furthermore the proportion of the different sectors combined in connectivity calculations has also changed significantly across the time period. The total number of cities incorporated in the dataset has also increased greatly in the 2008 data. Due to these changes in the composition of the dataset for the three census periods, direct comparisons could not be made without adopting a rigorous standardization method to regularize the basis for data analysis.

A comparative method adopted by Derudder *et al.* (2010) standardizes connectivity values at an index level. However, for the present exercise we adopted a different approach in order to achieve greater accuracy required for the in-depth analyses to follow. In order to avoid the removal of cities with low connectivity for the year 2008 when considering time series changes, we standardized the GaWC datasets at the most disaggregated level of city pairs ('dyads'). This standardization method results in a smaller overall database however connectivity changes observed on this basis allow us to focus on changes in the constitution of the WCN and the ECN (European Cities Network) scales with precision.

The final standardization for the three census periods covers five sectors: banking/finance (hereafter referred to as financial services), accountancy, law, advertising and management consultancy, involving the following numbers of firms and cities worldwide:

- Year 2000, 100 leading APS firms present in 315 cities world wide;
- Year 2004, 92 APS firms in 315 cities;
- Year 2008, 175 APS firms in 525 cities.

We follow Derudder *et al.* (2010) in extracting a subset of 285 cities present in all three datasets. All connections were then recalculated for each year, and also separately for each sector. Standardizing at this level does not change the characteristics of the network so the new global network connectivities (GNCs) are directly comparable without other need of data transformation.

After recalculating all connectivities, the dyad values across the whole network matrix were standardized again for each year and also separately for each sector. Because the datasets contain a different number of firms in each sector for the three years, to give each sector the same weight in terms of global connectivity across the years, we have then given each sector the same weight it had in 2008 and adapted the previous years to this. All dyads were thus rescaled for each sector to the same proportion over the years by adapting the connectivities

for each sector to the 2008 weight. Finally, summing all dyads across the five sectors we obtain a new standardized GNC that can be directly compared. Figure 1 and figure 2 (in appendix A) provide distributions of standardized connectivities for all APS, in other words GNC, and for banking/financial services network connectivity (FNC) respectively, showing that there is no sub-network distortion.

This data standardization allows direct comparisons to be made between the three census periods however an important limitation is that observations regarding emerging cities in the WCN during this period are not possible if they were not included in earlier census periods. For example, Eastern European cities not included in the first datasets, but which have since developed significant connectivity in the WCN, are missing from the analysis. For this reason, we include additional analyses using non-standardized data for the year 2008 only, in order to reveal cities which have gained connectivity by the time of the last census period. This is important to show changes in regions, for example Eastern Europe, which have been undergoing significant political and/or economic change during the past decade.

Because a key objective of this working paper is to examine Europe's changing territorial relations in global advanced services networks, in some analyses, a 'Mappa Mundi' exercise (Vinciguerra *et al.*, 2010) has been used to identify and visualize the position of cities and territories in terms of their network centrality where geographical distance is not considered. Visualizations represent the servicing spaces between cities, and within and between states (territories). These are achieved by using a spring embedding algorithm which assigns forces to every city link (dyad), represented by 'springs', hence the term 'spring embedding'. The effect is that a repelling force is applied when nodes are too close together and an attractive force is applied when nodes are too far apart, at the same time, the strength of forces is influenced by the link value. The outcome is a continuous changing in the position of nodes within the graph, throughout iterations, until an approximate equilibrium is reached. Euclidean distances between nodes are proportional to graph distances thereby representing the relations of cities and territories in network space, however it should be noted that the method results in a variance of outcomes between the visualizations which must be taken into account in making comparisons.

## **APS connectivity - Developments in the European City Network**

This section documents the connectivity position of cities for all APS sectors, their rankings and their changing positions over time, in the European WCN subnet, here referred to as the ECN. By reference to the APS standardized time series data, changes in city connectivity rankings at a European scale can be noted. Tables in appendix A provide complete data whilst highlights from the analyses are discussed in the main body of the paper and illustrated in figures presented in appendix B.

Two main observations are the consistent top rank position of London's APS connectivity in all years and the rise of Eastern European cities' connectivity.

Table 1 shows that London remains Europe's top-ranking APS centre followed by Paris, Milan and Madrid. This group of four cities leads consistently in each year. Other consistently high performers are Brussels, Munich and Amsterdam, although Amsterdam loses some connectivity by the year 2008. By comparison, Frankfurt shows a significant decline in ranking position and connectivity over time, rank 14 in 2000, 12 in 2004 and 29 in 2008. In contrast to Frankfurt's diminishing importance within the ECN, Athens increased its rank position from 55 in 2000 and 45 in 2004, to 37 in 2008, just before the impact of the current financial crisis.

ECN 'Mappa Mundi' maps based on time series, standardized, data (see further explanation of this term and the method used in Vinciguerra *et al.*, 2010) depicted in figures 3, 4 and 5,

show the changing territorial position of European *countries* through a city-centred lens. Note however that countries with emerging APS connectivity will appear peripheral in 2008 because only cities having connectivity in all three censuses are included in the standardized database used in this comparative analysis. This will apply particularly to East European countries with cities undergoing political economy changes that have paved the way for connectivity increases which have become significant by the year 2008.

Focusing first on the North West European and Southern/Mediterranean regions, in both 2000 and 2008, Germany can be seen to have a central position in the ECN. Whereas the UK is relatively central in 2000 and in 2004, its position is less central than that of Germany by 2008. All other countries are on the periphery of the network in 2000, but by 2004, France and Italy join Germany and the UK in a group of countries that have a semi-peripheral network position; Italy is replaced by Switzerland in this grouping by 2008.

Turning to consider the connectivity position of the East European region, which we expect to be under-represented in the Mappa Mundi exercise, table 1 (appendix B) reveals that, in spite of the region's peripheral position in the ECN between 2000 and 2008, a number of cities are increasing the connectivity position of their countries. Warsaw increased its ranking from 37th (134) in 2000 to 25th (186) in 2008. Prague and Budapest have also increased their ranking and their connectivity during this time period. The ranking of Bucharest has increased substantially from 80<sup>th</sup> in 2000 to 53<sup>rd</sup> in 2008. There is clear evidence that the region is changing and there is a general pattern of rising connectivity. Sofia has also increased its ranking from 120<sup>th</sup> in 2000 to 77<sup>th</sup> in 2008. Given the comparative database will under-record overall changes for the region, the developments noted in Eastern Europe are significant.

Figure 6 (in appendix A) shows a different visualization of the territorial geography associated with ECN connectivity for the year 2008, again using the standardized data. Here we show the connectivity that cities confer on European regions. Figure 6 shows 'four Europes' which have differing interrelationships in APS cross-border networks. Ex-Communist Eastern Europe is strongly connected to North West Europe by its cities that are nodes in APS networks, North West Europe is also strongly interconnected with Southern/Mediterranean Europe however Northern Europe proves less well connected in the ECN than all other European regions (followed by Southern/Mediterranean Europe) although its strongest connections are again with North West Europe. Figure 7 shows the position in 2008 according to the non-standardized data in order to include the connectivity of cities which are not represented in the time-series analyses. This shows the rise of semi-peripheral cities such as Warsaw and Moscow. The 2008 Mappa Mundi treating Europe as a 'state', based on this same non-standardized data (figure 8), shows Europe's centrality in the WCN compared with the US, and also the centralizing dynamic of China, followed by India.

### **APS connectivity – Europe's place in the world**

Considering the European territory in a world perspective, the data in table 1 (appendix B) show that 61 out of 95 cities in Europe have increased their WCN connectivity between 2000 and 2008. The APS WCN Mappa Mundi shown in Figs 9, 10 and 11, in which cities are grouped by countries, shows how the US has centralized in the WCN during this time period. China can be seen to have moved towards a central position from the year 2004 however, as discussed with reference to Eastern European countries in the ECN, the rising position of China is underplayed in this analysis because Chinese cities which have only connected to the WCN recently are not included in the standardized data set. Significantly, by 2008, the UK has apparently moved into a peripheral position in the WCN in spite of the top world connectivity rank of London.

Table 3 sheds light on the dynamics of the connectivity changes of specific cities by ‘rank jump’ and by ‘connectivity jump’ in the WCN respectively. Cities can gain connectivity while decreasing their rank order position. Connectivity jump analysis makes it possible to see how individual cities are gaining or losing connectivity as globalization proceeds, independent of their changing rank order.

In China, Shanghai and Beijing have gained substantial APS connectivity during the eight year time period, ranking 28<sup>th</sup> and 30<sup>th</sup> respectively in 2000, 22<sup>nd</sup> and 20<sup>th</sup> in 2004, and 8<sup>th</sup> and 10<sup>th</sup> in 2008. In general, Asia Pacific cities have dramatically increased their share of the upper rankings. For example, Sydney has increased its rank position from 12<sup>th</sup> in 2000 to 7<sup>th</sup> in 2008 and Seoul’s rank has jumped from 32<sup>nd</sup> to 12<sup>th</sup> in this period. In central Asia, Mumbai has increased its connectivity from 23<sup>rd</sup> to 16<sup>th</sup> and in the Middle East, Kuwait’s rank position has changed from 123<sup>rd</sup> to 76<sup>th</sup>. Shanghai’s connectivity jump has been a remarkable 93, Beijing 89, Moscow 79, Seoul 76 and Rome 57, followed by significant connectivity jumps by Tel Aviv, Mumbai, Kuala Lumpur, Sydney, Warsaw and Hong Kong respectively. In contrast, Los Angeles has experienced the second worst rank decline (25 rank positions) in the world while Abidjan has been the world’s worst performer (140 rank positions).

Turning to the world geographical dimension of these developments, whilst the Asian region, especially Pacific Asia, contained many of the world’s most upwardly mobile cities by the year 2008, cities in the US have lost rank position and in some cases actual connectivity by 2008 except for New York. Chicago has shifted rank position from 7<sup>th</sup> to 19<sup>th</sup> even though its actual connectivity has been quite stable. However Los Angeles’ falling rank from 10<sup>th</sup> to 35<sup>th</sup> has been associated with an actual connectivity loss and San Francisco’s fall from rank 17<sup>th</sup> to 44<sup>th</sup> reflects a connectivity reduction from 167 to 141.

In addition to the previous cities discussed, there has been a pattern of large falls in rankings for North American cities in general – Atlanta 36 to 46, Miami 27 to 67, Montreal 48 to 72, Vancouver 66 to 88, Minneapolis 72 to 92, Seattle 65 to 93, Philadelphia 70 to 98. Only 20 out of 48 cities in the North American region of the world have increased their connectivity. Even the WCN connectivity and rankings for Sub Saharan Africa have been more stable than those of North America. In comparison with North America, South America has shown a less consistent pattern of change. For example, Buenos Aires has jumped from rank 22 (connectivity 153) to rank 17 (connectivity 199). Santiago has also increased both its ranking and its connectivity but in spite of having a connectivity gain, Sao Paulo has lost out in terms of its rank position.

The Mappa Mundi presented in figure 8 has been created using non-standardized data for the year 2008 in order to check the position of the European territory against this backdrop of world change by grouping together the countries of constituent Member States. Figure 8 illustrates that Europe has a very central position in the 2008 WCN, which surpasses that of the US, when depicted according to present territorial policy cooperation. Its position is enhanced in this analysis by the inclusion of more East European cities than in the standardized data used to examine change dynamics. It should be noted from figure 8 that India and China were moving towards the centre of the WCN in 2008 also.

Overall, the picture described in APS connectivity analysis is one of increasing connectivity of most WCN cities. In the order of 60% of cities (171 out of 285 cities) increased their connectivity between 2000 and 2008. However some other cities have fared badly for reasons which cannot be explained on the basis of quantitative data and analyses alone.

### **Connectivity conferred on the WCN by different APS sectors**

Next we delve deeper into the structures of the WCN to gain an understanding of the specific APS sectors – financial and business services: law, accountancy, advertising and management

consultancy that are interlinking the European territory to the WCN space of flows. At a WCN scale, London, New York, Hong Kong and Paris show stability across the census periods. Tokyo's connectivity declines a little but not for financial services. This general stability of established APS centres is counterbalanced by a global shift to the Pacific Asia region with strongly increased connectivity of Shanghai, Beijing, Seoul and Sydney in terms of rank order and connectivity for 2008.

First we examine the rankings and connectivity over time of cities in the five sectors (see tables 4 to 13). Decreasing and/or increasing rankings are not always represented by the same downward and/or upward dynamic in connectivity levels, for example, an increase in connectivity could be associated with a decrease in ranking, and vice versa, dependant upon the relative network dynamics involving other cities. Second, we consider the top city dyad relations for all APS and for each sector in the three censuses (tables 14 to 19).

*Accountancy:* For the accountancy sector, London and New York were always the two most highly connected cities in the WCN for each census period. Paris had third position in 2000 but decreased to 7<sup>th</sup> rank position in 2008. Hong Kong was third in 2008 having had a connectivity jump of 26.16 and a rank jump of seven positions (see table 5). These four cities were consistently the world's most important cities in terms of their accountancy network connections with other cities worldwide. In all, a total of 173 cities increased their connectivity in world-wide accountancy networks. Cities across Eastern Europe represented in the time-series data, have been important locations for increased connectivity in this sector. Warsaw has been the leading city, followed by Bucharest, which had a very large WCN rank jump from 147<sup>th</sup> in 2000 to 47<sup>th</sup> in 2008. Together with Prague and Budapest, these are the leading four accountancy cities of the region. Sofia, Ljubljana and Krakow all experienced large connectivity and rank jumps, moving up in the order of 100 rank jump positions. Cities in emerging world regions also show major accountancy network connectivity jumps. Beijing, Tel Aviv, Shanghai, Seoul and Kuwait have top connectivity and rank jumps.

*Advertising:* In the advertising sector, New York, London, Paris, Hong Kong, Tokyo and Singapore are the most highly connected WCN advertising cities for all three years 2000, 2004 and 2008 (see table 6) however 176 cities in the world increased their connectivity in this sector. As in the case of accountancy, cities in emerging economies showed the strongest connectivity increases. Moscow had the biggest connectivity and rank jumps of any city in the WCN (rank 53 in 2000 to 7 in 2008, table 7). Shanghai jumped from rank 41 in 2000 to 8<sup>th</sup> in 2008. Bangkok in the emerging world and Stockholm in Northern Europe also outperformed other cities. Eastern Europe however proved less well connected in world advertising networks with Warsaw ranking 9th in 2008 but followed next by Budapest at rank 23.

*Management consultancy:* 169 cities across the world increased their connectivity in management consultancy networks. New York, London and Paris are consistent top connected cities in the WCN in the three census periods and in this sector (table 8) Chicago has also performed well (rank jump 9 in 2000 to 4 in 2008, see table 9). Again the Asian region shows increasing strength; the largest connectivity jumps were Mumbai (rank 56 in 2000 to 11 in 2008), Shanghai (rank 64 to 22). Hong Kong and Singapore also had important jumps. Some Chinese cities had low or zero connectivity in management consultancy in 2000 but have experienced very large rank jumps to 2008. East European cities have also had connectivity and rank jumps (Budapest rank 32 and Warsaw rank 35) however they are outperformed by Chinese cities.

*Law:* In contrast to other sectors, the connectivity of cities in law networks has been relatively stable. Top WCN rankings in this sector were New York and London (table 10). Paris increased its rank from 7<sup>th</sup> in 2000 to 3<sup>rd</sup> in 2008, whereas the rank of Frankfurt dropped from 3<sup>rd</sup> in 2000 to 4<sup>th</sup> in 2004 and the ranking of Brussels (6) did not change across the census dates. In the US, Washington similarly ranked 5<sup>th</sup> in 2000 and 2008. Across the world, law

generated less significant rank jumps than the other sectors studied – only 62 cities increased their connectivity and many cities lost connectivity. The biggest rank changes were again in emerging regions where Shanghai jumped from rank 29 in 2000 to 11 in 2008 (table 11) and Dubai jumped from 80 in 2000 to 35 in 2008. In general however, law networks appear to have been more closed than services in other sectors in recent globalization.

*Financial services:* Banking/financial networks are of special significance in considering territorial relations and distinctions in the European and world regions due to their interdependencies with real estate investment flows and crisis, studied in working paper 3. As for the other service sectors, not all of the 285 cities studied are connected to financial services networks; individual cities are involved in different networks to different degrees. Only 82 cities increased their connectivity in this sector by the year 2008, showing that much of the WCN connectivity which is increasing in APS overall, is contributed to by other sectors.

Similar to other sectors, London and New York have kept their predominance in financial services (table 12) through the years also; these cities are followed consistently over time by other major world cities Tokyo, Hong Kong, Singapore and Paris, confirming their dominance in global financial services. In China, as for APS, Shanghai and Beijing have gained significant financial services connectivity, Shanghai's connectivity has increased from 25.78 in 2004 to 34.03 in 2008. This is reflected in the ranking of Shanghai which has changed from 18<sup>th</sup> in 2000, to 10<sup>th</sup> in 2004 and 8<sup>th</sup> in 2008 (table 13). Furthermore, Beijing's rank position has also changed considerably, going from 24<sup>th</sup> in the year 2000 to 12<sup>th</sup> in 2008. Increasing rankings in financial services make this APS sector a key driver increasing the world city network connectivities and rank positions of these Chinese cities.

Elsewhere in the world, Moscow has had the highest financial services connectivity increase world-wide, increasing from 17.79 in 2000 to 27.29 in 2008, followed by Seoul (22.62 in 2000 to 30.93 in 2008) and Dusseldorf (1.72 to 8.96). At the same time, cities experiencing decreases were Durban (from 21.22 to 1.18), San Francisco (from 27.31 to 18.12) and, in Europe, Hamburg (from 17.50 to 7.02). Luxembourg stands out as an example of a city having a dominance of financial services; its consistent rankings of below 50 in other sectors are contradicted by a higher connectivity position these services (28 in 2000, 21 in 2004, and down to 36 in 2008). Evidently financial services are a very strong component of Luxembourg connectivities in the world compared to the other APS sectors studied in this analysis.

Figures 12, 13 and 14 present the financial services standardized data in Mappa Mundi analyses in order to show how network connectivity in this sector has been connecting countries to the WCN in the three census periods. They show that the US was more central in the WCN in 2000 for this sector than for APS as a whole (see figure 9). The UK and Italy were more central than Germany in 2000 unlike the relative Mappa Mundi position for Germany for all APS (see figure 9). The US has retained this strong position in 2004 and 2008 and significantly China became more central in financial services than the UK by 2008 (figure 14).

### **Europe's position in the world – City dyad analysis**

In order to look more closely at the ways in which the different service sectors have been interconnecting European cities in the WCN at the time of the three census periods, we also use a sector-based dyad analysis to shed light on their emergent network interrelations. Tables 14 and 15, show that the top dyad in the WCN for all APS and for financial services from 2000 to 2008 has consistently been London-New York. Due to the importance of this dyad,

we consider London's other top sectoral dyad relations over time in order to see how these have been positioning Europe in the WCN.

Looking at the change in dyad values over time, it can be observed that in general all values have increased (tables 14 to 19). Although the London-New York dyad is the maximum value for each year of analysis, relative to this, many dyad values have increased over time, especially dyads involving European cities. The top dyad values involving European cities (table 20), reveal an overall increase in value but some differences between sectors. Whereas financial services show a slight increase in dyad values, accountancy and advertising services show an important increase. In contrast, law can be considered stable over time and management consultancy has decreased its dyad values.

The Paris-London dyad dominates in most sectors in 2008, but this has not always been the case. In previous years, London-Amsterdam dominated for the advertising sector in 2000 and 2004, and the London-Frankfurt dyad was strongest in legal services in 2000 and 2004. In general however, considering all APS sectors, the combination of top dyads within Europe has not changed much over time. London was connecting to Paris, Frankfurt, Milan, Brussels, Madrid, Amsterdam and Zurich in the year 2000 and Paris was similarly connecting with Milan, Frankfurt and Madrid. In the following years the connections between London and Munich, Warsaw and Budapest increased their importance by 2004 but decreased again in 2008. Nevertheless, this group of cities is present in all the top European dyads, connecting either to London or to Paris, with some exceptions, meaning that London and Paris have a very central position among all European cities in all APS sector networks analyzed.

For *financial services* dyads, there are slight differences with other APS sectors, except for the presence of a strong Dublin-London dyad in all three years.

In *accountancy*, the Vienna-London dyad has increased its value over time but still ranks in a high position changing from 2<sup>nd</sup> in 2000 to 4<sup>th</sup> in 2008. Below that, in 2000, cities like Copenhagen, Stockholm, Oslo and Barcelona connecting to London with high dyad values have been overtaken by Rome and Lisbon in 2008 as they have gained higher connectivities to London in this sector.

In *advertising*, Lisbon, Copenhagen and Vienna are connecting to London and joining the top 10 dyads connections in 2000.

In *law*, the first dyad that does not include London or Paris is the Frankfurt-Brussels dyad which has consistently been present amongst the top 10 law dyads over the years, reflecting the connectivity falls of some European cities in law networks (table 20).

Turning to the non-standardized data for financial services alone, Mappa Mundi network visualizations treating the EU as a state (figure 15), and on a country basis within Europe (figure 16), show the territorial geographies of the world and of Europe.

The US, led by New York, is shown to be central in financial services networks in 2008, followed by South Korea, due to the connectivity of Seoul alone. China is also shown to be centralizing in financial services networks, overtaking Japan. This country map shows that the UK has a peripheral position because the US gains strength from its scale of urbanization. This suggests that China could eventually overtake the US due to its dynamic urbanization strategy. The non-standardized 2008 data for financial services in the ECN show Germany to have the most central network position in Europe due to the high total connectivity of the group of cities within its territorial country boundary.

Table 2, also shows a comparison between APS and financial services connectivity for the non-standardized data in 2008. London, New York and Hong Kong are the top three centres for all APS but Hong Kong is stronger for financial services than for all APS. Paris had similar connectivity for all APS and for financial services but is ranked 4 and 6 respectively. Shanghai is rank 9 / connectivity 68.51 for APS and rank 7 / 76.86 for financial services.

Beijing ranks 12 for financial services. Seoul is 13 for APS and 9 for financial services. Taipei is 28 for APS and 13 for financial services. Frankfurt is 32 for APS and 16 for financial services. Warsaw is 20 for APS but only 28 for financial services though its respective connectivity levels are not very different. No other Eastern European cities are present in top financial services rankings though Budapest is APS 36 and 49 for financial services. Europe is thus less well connected for financial services than for APS.

## **European globalization strategies**

Allowing for territorial borders in network analysis shows the significance of state and EU policy for cities and the importance of city network connectivity for states and the European territory. The final analysis can inform strategic European policy by examining the strategies of 160 advanced producer services firms with offices located in European cities; 15 firms from the original 175 firms have dropped out because none of them had offices located in European countries. Cities with a GNC score of 0.2 and above have been selected, resulting in a population of 117 cities in total. The analysis illustrates the way in which the practices of global firms are impacting on the European space.

A principal components analysis has been run on a service values matrix comprising the 117 cities. A standard Varimax rotation was applied and the output scores have allowed analysis of city relational outcomes generated by the 160 firms. For six factors, output scores can be interpreted as representing the strategies of the global firms using cities in the European territory (table 24):

*Factor 1 – ‘Outer’ European Capitals Strategy’ (note London is low and not Paris)*

*Factor 2 – ‘Primate’ Strategy’ (London) – i.e. firms just focusing on London for European work*

*Factor 3 – ‘Major Western Europe Cities Strategy’ (but not Paris, London and Brussels)*

*Factor 4 – ‘German Strategy’*

*Factor 5 – ‘British Strategy’*

*Factor 6 – ‘Dual Strategy’ (Paris-Brussels Axis)*

Figures 17 to 22 show the relationships between European cities in each of the six strategies, with cities positioned in their approximate geographical locations. These ‘maps’ highlight the importance of each city in every group. The scores for each of the factors represent the strategies that are inter-connecting European cities which are generally invisible in conventional statistical studies informing policy debate. Negative scores are also informative because they reveal where global firms have a weak presence in Europe.

Positive score values (red cities in the figures) indicate where each strategy is strong whereas negative values (blue cities) indicate where these strategies are weak; grey cities are those which are not important for the group strategy. The size of the cities is proportional to their score values however in the case of negative values (blue cities), absolute values were applied in order to allow these cities to be visible. City labels are only shown for cities which are part of a group.

Notably, factor 1 is an ‘outer’ European capitals strategy, showing that nodal connectivity generated by global firms is leading to significant interrelations between Europe’s ‘less primate’ cities. Digging deeper into the database, the importance of *non-financial services* firms (79% of firms involved in the outer Europe strategy, mainly accountancy and advertising) in generating ECN connectivity is endorsed. In contrast, in the ‘primate’ strategy (factor 2 - London), 51% of firms are financial services. There appears to be no general North-South contrast but there are strategic East-West patterns (shown by the factor 3 strategy), suggesting that fractured territorial relations in the ‘Cold War’ has had a lingering influence on ECN development.

## Conclusion

The results from the APS analyses show that, at the WCN scale, the network positions of London, New York, Hong Kong and Paris have been stable from 2000 to the first half of 2008 just before the financial crisis. However there has been a dramatic re-balancing of WCN connectivity due to the increase in global APS firms and functions in cities in the Pacific Asia region, especially in Shanghai, Beijing, Seoul and Sydney. Furthermore, city APS connectivity is increasing more generally with 60% of cities worldwide becoming better connected to the WCN between 2000 and 2008. These connectivity increases, together with some decreases, are changing the rank order of cities in the WCN quite significantly.

Nevertheless, inter-city links generated by connectivity to APS overall, and to financial services specifically, have remained strongest between London and New York during this period of world change. Inter-linkages between many other city pairs (dyads) have increased over time, reflecting changing connectivity patterns and, significant for European policy, especially between city dyads involving Europe. Within Europe, it is interesting to note that East European cities are present in all the top ECN dyads, connecting either to London or to Paris, both of which have a central position. In spite of Eastern Europe's peripheral position in the ECN in 2000, a number of cities - Warsaw in particular but also Prague and Budapest – have increased the position of their countries by 2008.

Looking at the world through a territorial lens by taking into account nation state boundaries, in spite of the stable top world connectivity rank position of London, the UK (as a state) had moved into a peripheral position in the WCN by 2008 due to the relatively weak connectivity of other UK cities. In contrast, the US has retained its WCN centrality, reflecting the size of its territory and number of APS centres. Nevertheless, most US cities apart from New York, including Chicago, show a pattern of declining WCN rank position and, in some cases, falls in actual connectivity due to overall WCN rebalancing. A global shift in WCN connectivity has been greatly contributed to by Asia Pacific cities whereas, in contrast, Los Angeles in the US, has experienced the second worst WCN rank decline in the world.

If WCN connectivity is represented using a different *non-country* definition and lens which take into account the territorial cohesion and policy remit for the European Union, we see that in contrast to the structural changes occurring in the US, 61 out of 95 cities in Europe have increased their WCN connectivity between 2000 and 2008. This gives Europe, depicted as a geo-political entity, a more central position in the 2008 WCN than the US albeit the movement of China and India towards the centre will continue to be fuelled by rapid large scale urbanization and economic development. Ongoing fluidity of WCN geographies and continued developed/developing world region rebalancing with implications for territorial policy, can therefore be expected.

It will be important for European Union and member state policy responses to take into account the APS sectors that are driving WCN and ECN connectivity changes. In spite of the dominant position of the US (New York) and the UK (London) in financial services networks, Moscow has had the highest connectivity increase in financial services in the world since 2000 and China, now with three major international financial centres (Hong Kong, Shanghai and Beijing), became more central in WCN financial services than the UK by 2008. The European territory as a whole was less well connected in the WCN by financial services in 2008 than by other APS sectors.

Only 82 cities in the WCN increased their financial services connectivity between 2000 and 2008, demonstrating that important APS connectivity increases are generated by other sectors. For example, London and Paris have strong accountancy network connectivity and this is significant for policy given that as many as 173 cities in the world have increased their

connectivity in global accountancy networks. Notably, cities across Eastern Europe, led by Warsaw, Bucharest, Prague and Budapest, have been important locations for increased European accountancy connectivity and city rank jumps. Both accountancy and advertising firms are shown to be generating inter-city connectivity in the APS outer European capitals strategy which has equal significance to the primate (London) strategy.

The geography of the ECN space by 2008 shows ‘four Europes’ which have differing interrelationships in APS cross-border networks as a consequence of the strategies of global firms. Ex-Communist Eastern Europe and Southern/Mediterranean Europe were strongly interlinked with North West Europe. Northern Europe was least well connected in the ECN although its strongest inter-linkages are similarly also with North West Europe. The East-West strategies of global APS firms indicate the lingering influence of a legacy of political and economic division within the ‘new Europe’ territory. However there is clear evidence that Europe is changing with rising overall WCN connectivity across the territory, generated in and interlinking its global and globalizing APS centres.
